The inescapable clover-leaf

The roundabout supercollider

Lecture 5 – congenital abnormalities and normal development of the urinary system

What can go wrong? – Hereditary disorders of tubule function.

Bartter's syndrome (Type 1) – impaired SLC12A2

TAL
cells:

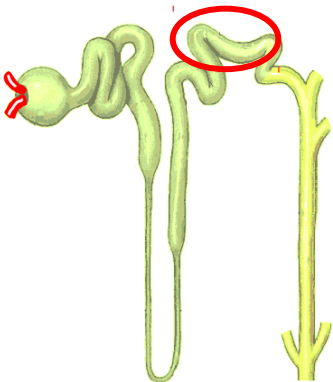

Effects (choose one)

- a) Loss of Na⁺, K⁺, modest H₂O, hypocalcemia
- b) Loss of Na⁺, K⁺, much H₂O; hypercalcemia
- c) Na⁺ loss, K⁺ retention, high aldosterone
- d) Diabetes insipidus (polyuria, polydipsia)
- e) Volume expansion (body), hypertension

What can go wrong? – Hereditary disorders of tubule function.

Gitelman's syndrome – impaired SLC12A3

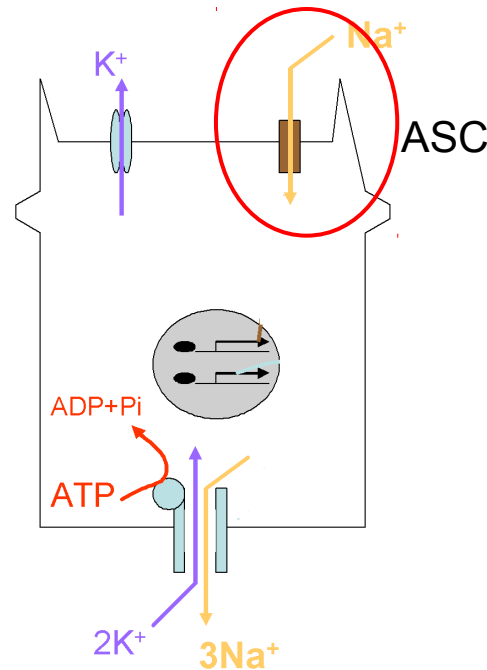

Effects (choose one)

- a) Loss of Na⁺, K⁺, modest H₂O
- b) Loss of Na⁺ K⁺, much H₂O; hypercalcuria
- c) Na⁺ loss, K⁺ retention, high aldosterone
- d) Diabetes insipidus (polyuria, polydipsia)
- e) Volume expansion (body), hypertension

What can go wrong? – Hereditary disorders of tubule function.

Liddle's syndrome – hyperactive ASC (=ENaC)

Effects (choose one)

- a) Loss of Na⁺, K⁺, hypocalcuria
- b) Loss of Na⁺, K⁺, H₂O; hypercalcuria
- c) Na⁺ loss, K⁺ retention, high aldosterone
- d) Diabetes insipidus (polyuria, polydipsia)
- e) Volume expansion (body), hypertension

What can go wrong? – Hereditary disorders of tubule function.

Pseudohypoaldosteronism – inactive ASC (=ENaC)

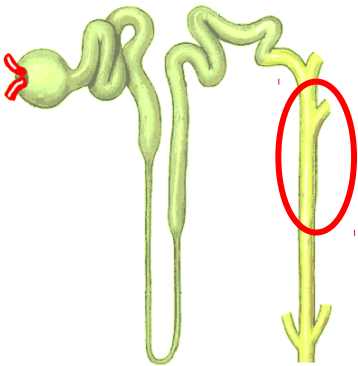

Effects (choose one)

- a) Loss of Na⁺, K⁺, hypocalcuria
- b) Loss of Na⁺, K⁺, H₂O; hypercalcuria
- c) Na⁺ loss, K⁺ retention, high aldosterone
- d) Diabetes insipidus (polyuria, polydipsia)
- e) Volume expansion (body), hypertension

What can go wrong? – Hereditary disorders of tubule function.

Inactivating Mutations of Aquaporins

Effects (choose one)

- a) Loss of Na^+ , K^+ , hypocalcemia
- b) Loss of Na^+ , K^+ , H_2O ; hypercalcemia
- c) Na^+ loss, K^+ retention, high aldosterone
- d) Diabetes insipidus (polyuria, polydipsia)
- e) Volume expansion (body), hypertension

What can go wrong? – Problems outside the kidney

Addison's disease (destruction of adrenal glands)

(JFK was a sufferer)

Effects (choose one)

- a) Loss of Na^+ , hyper K^+ , hypovolaemia
- b) Loss of Na^+ K^+ , H_2O ; hypercalcuria
- c) Whole body hypo-osmolarity
- d) Diabetes insipidus (polyuria, polydipsia)
- e) Volume expansion (body), hypertension

What can go wrong? – Problems outside the kidney

Psychogenic polydipsia

(this is just a random image of someone drinking, not a patient)

Effects (choose one)

- a) Loss of Na^+ , K^+ , hypovolaemia
- b) Loss of Na^+ , K^+ , H_2O ; hypercalcuria
- c) Whole body hypo-osmolarity

Final Topic:

Development of the kidney
(important because of congenital abnormalities)

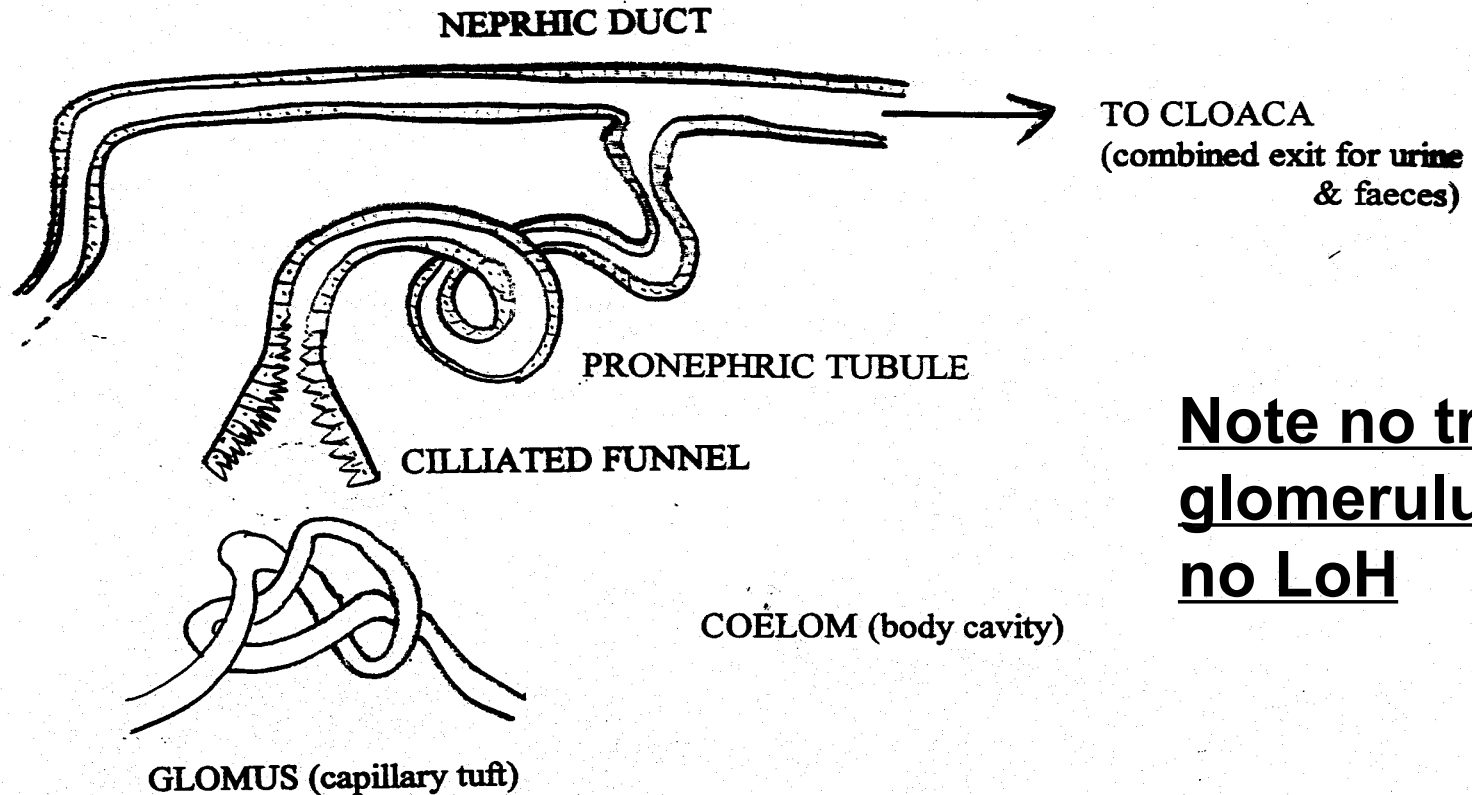

Image source: Life of Vertebrates (Young)

FIG. 58. Diagram to show arrangement of the pronephros in a freshly hatched lamprey.

g. gonad; *pr.* pronephros; *prd.* pronephric duct. (After Wheeler.)

Lamprey embryo:

Note no true glomerulus, no LoH

Adult:

FIG. 55. Lake lamprey attached to a bony fish, which also shows the scars of the attacks of other lampreys. (After Gage.)

Image source: Life of Vertebrates (Young)

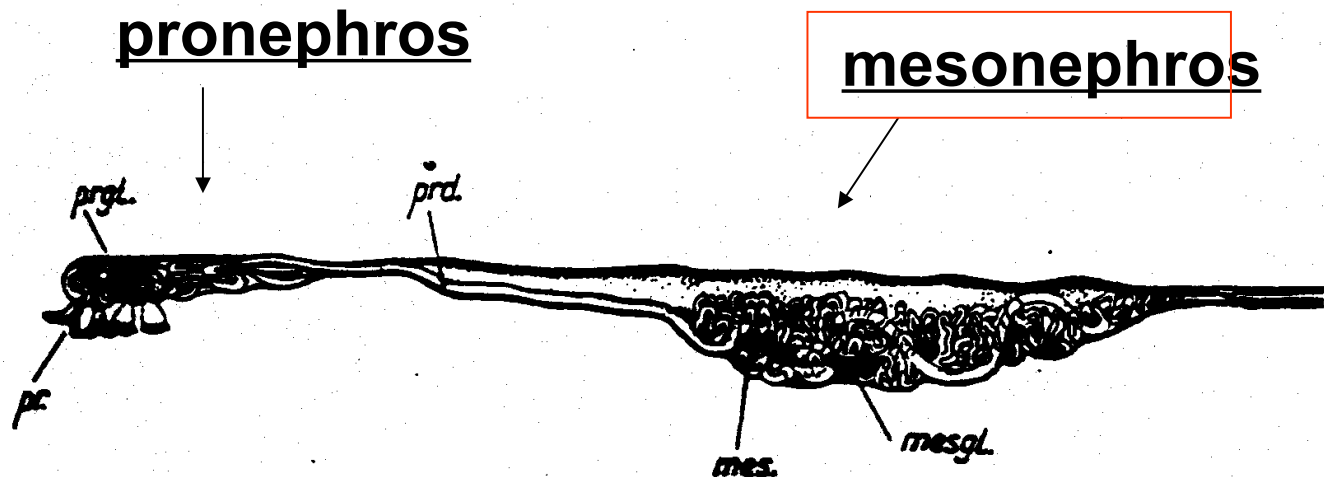

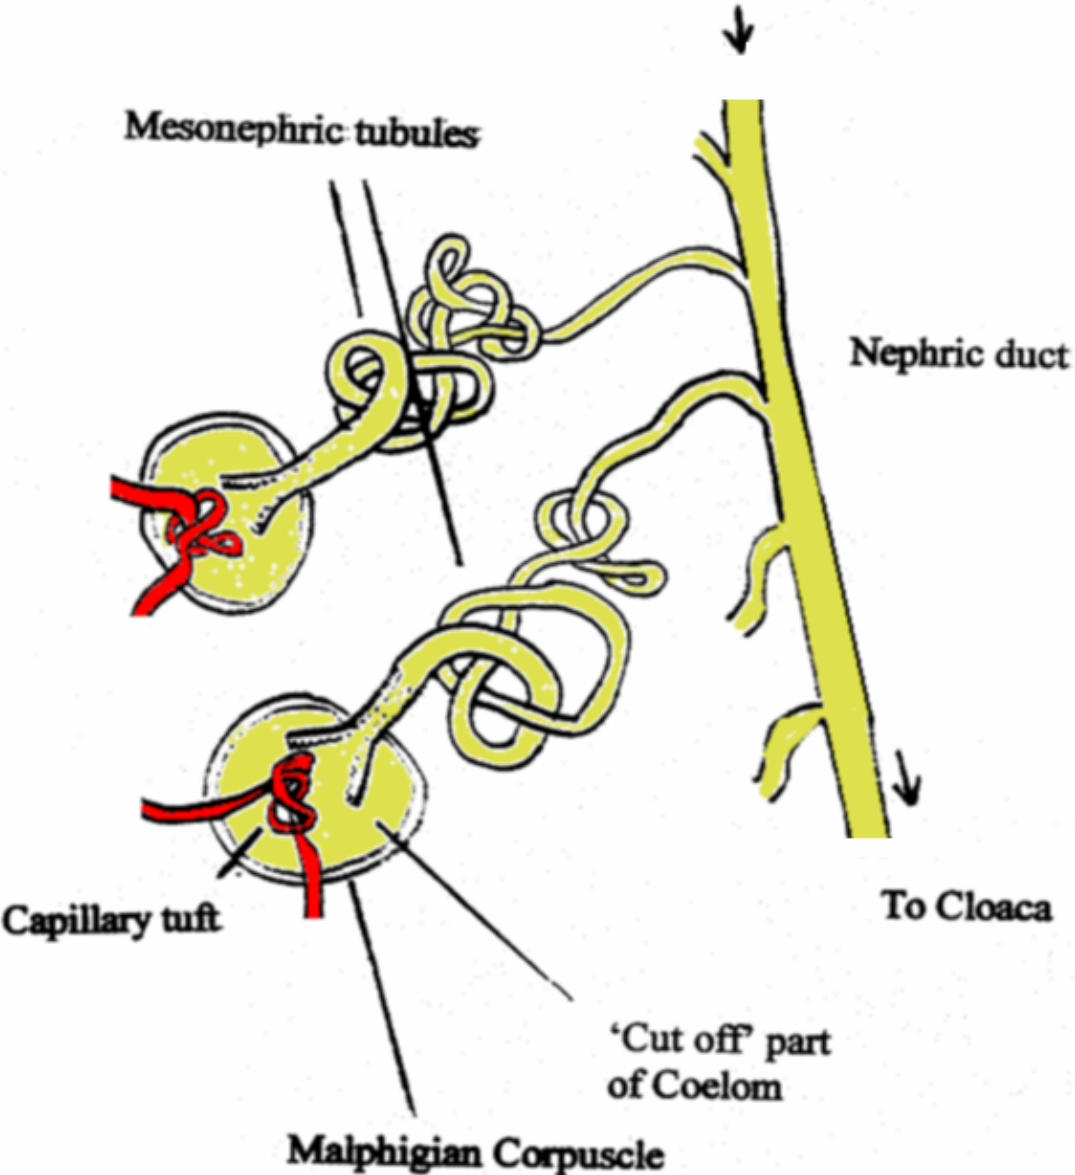

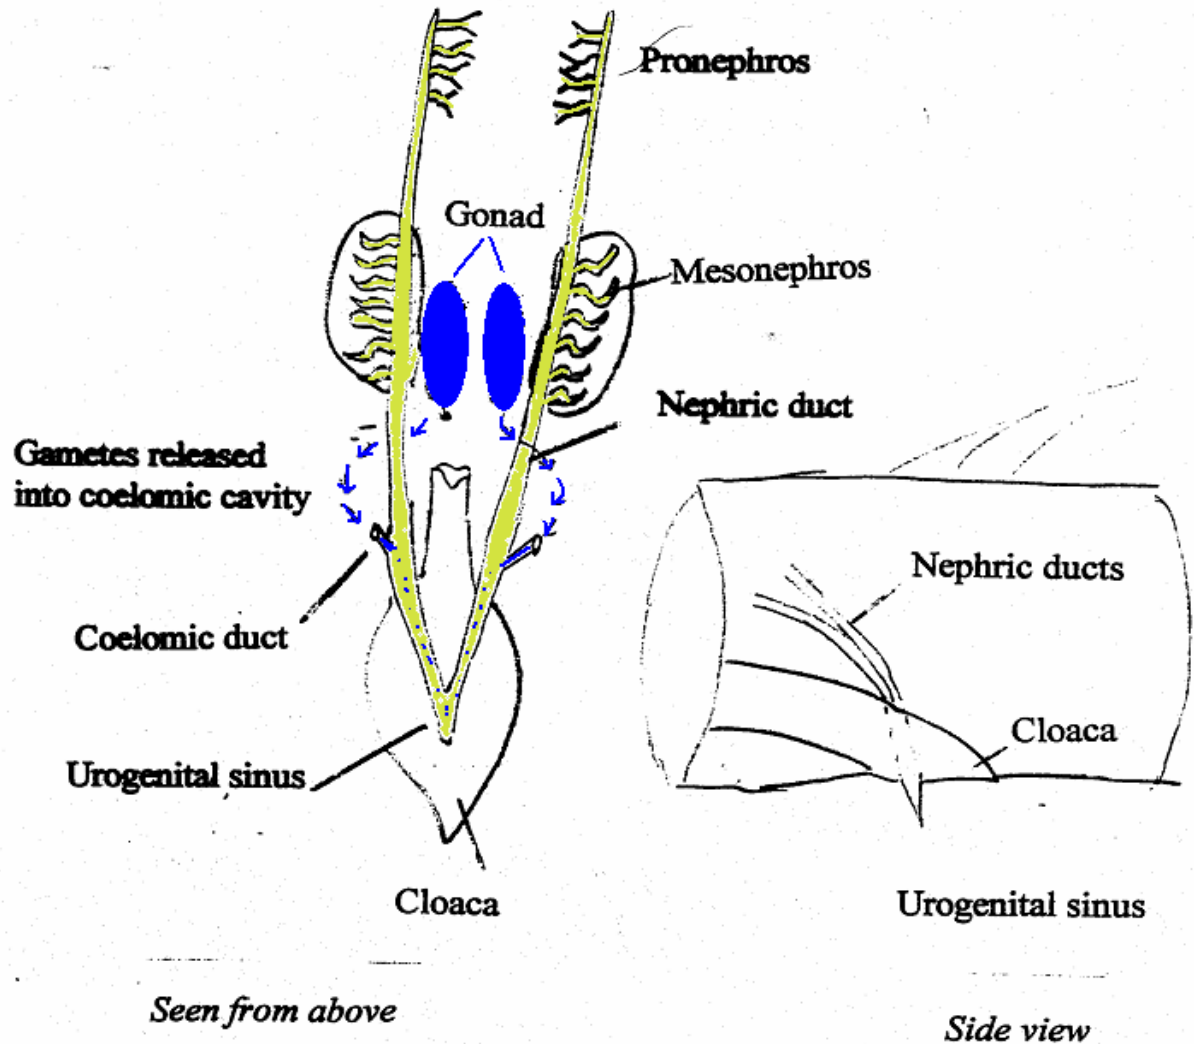

FIG. 60. Kidney system of a 22-millimetre larva of *Lampetra*.
mes. mesonephric tubules; mesgl. mesonephric glomeruli; pr. pronephric funnels;
prd. pronephric duct; prgl. pronephric glomeruli. (After Wheeler.)

From Pronephros

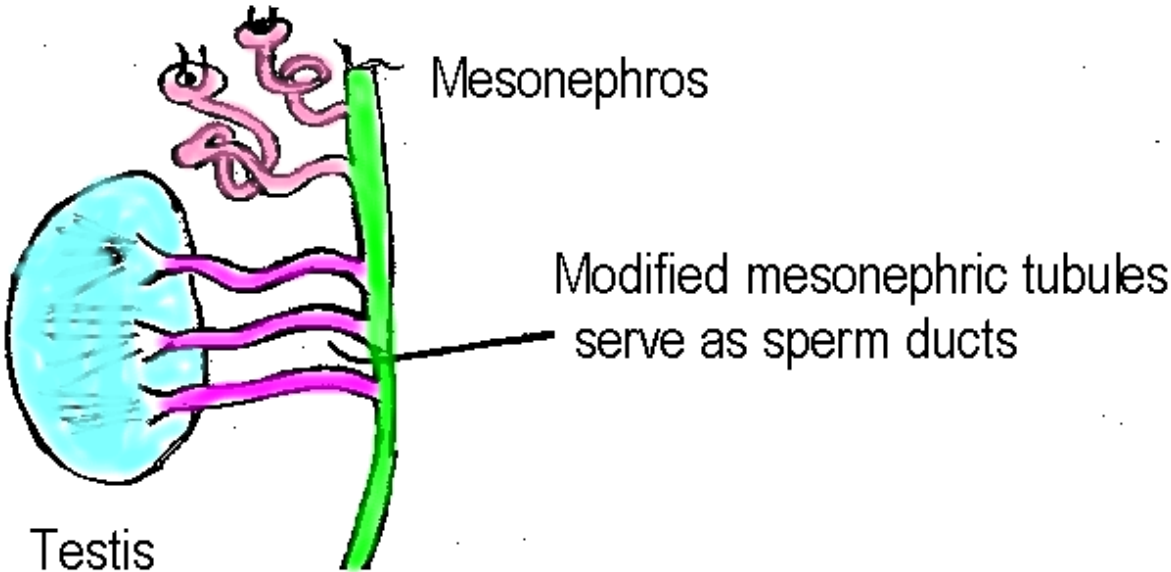

Reproductive system

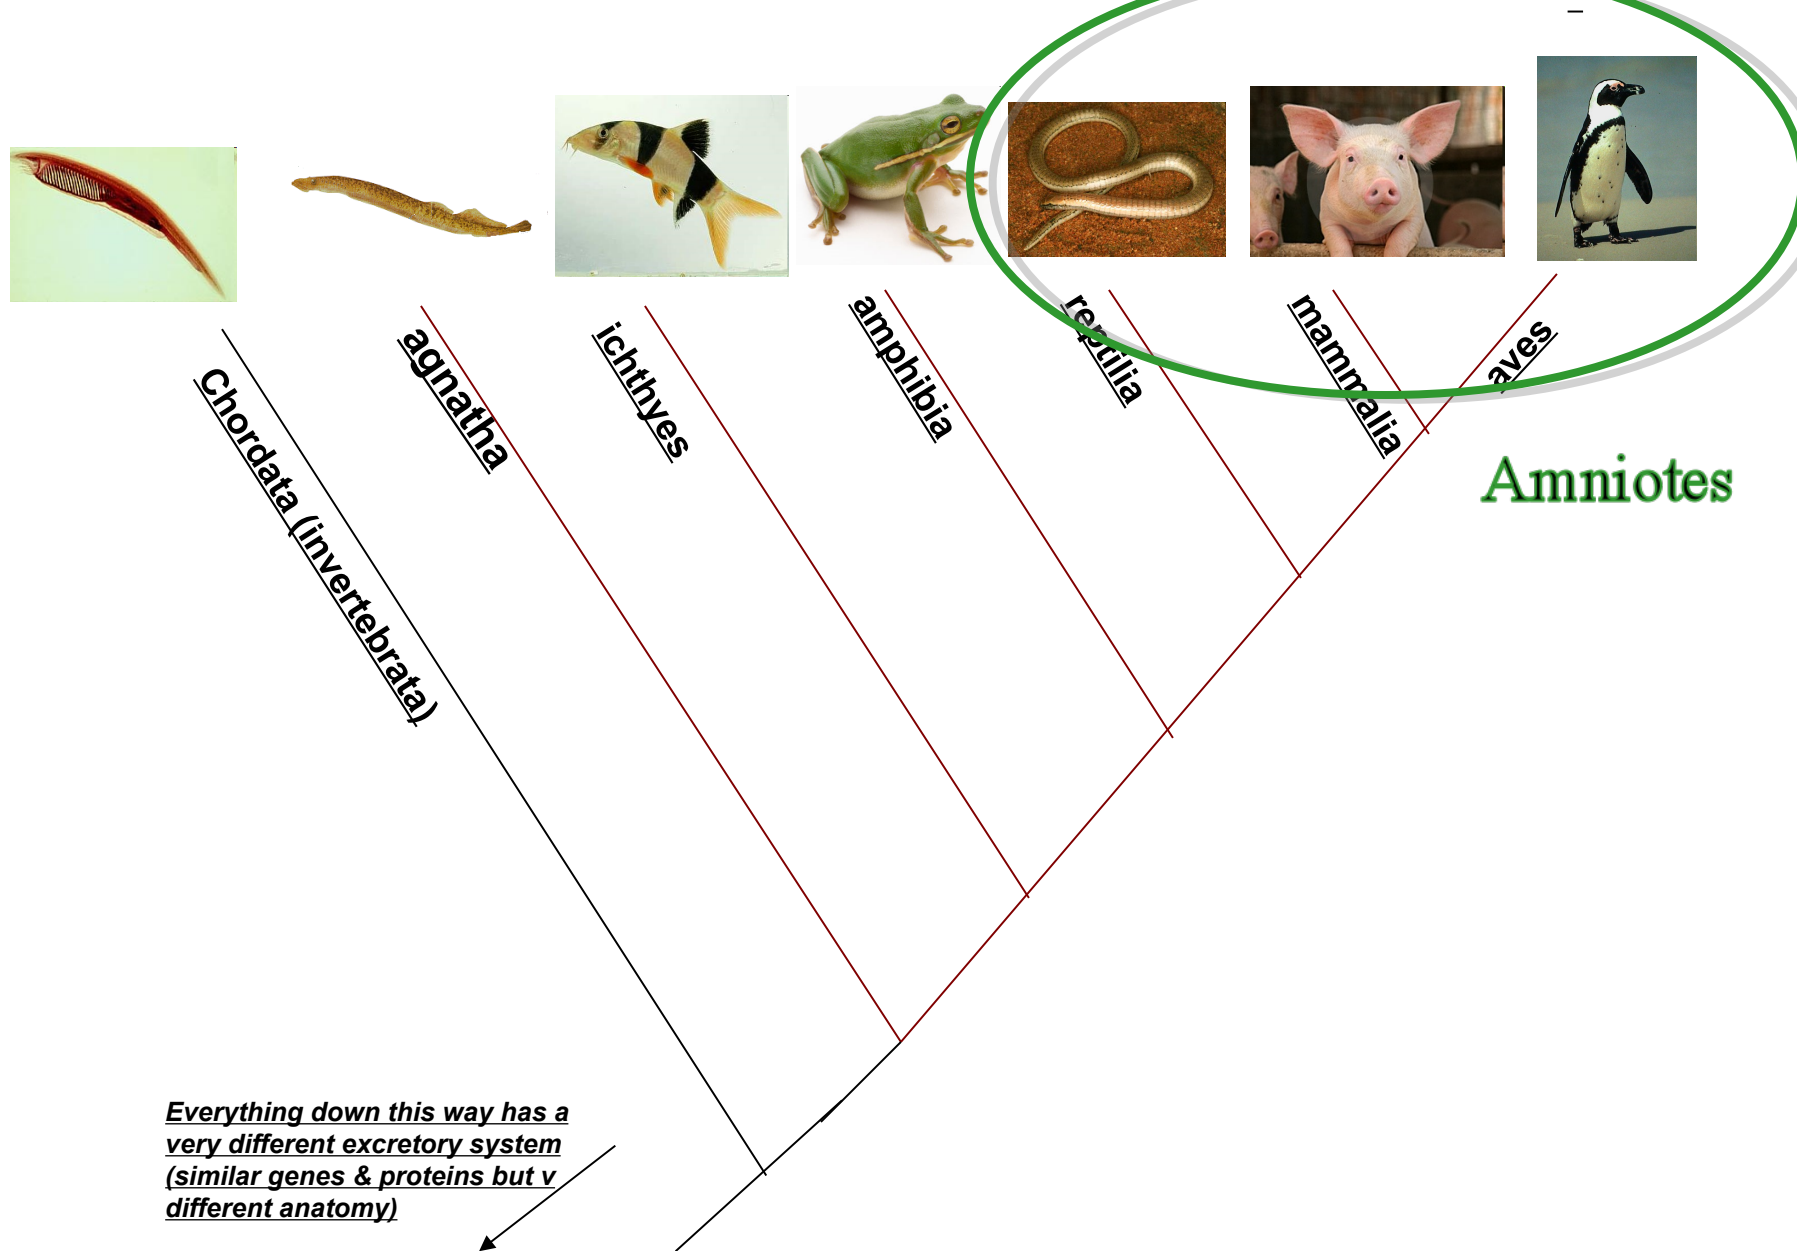

The above is true for BOTH SEXES

Rana

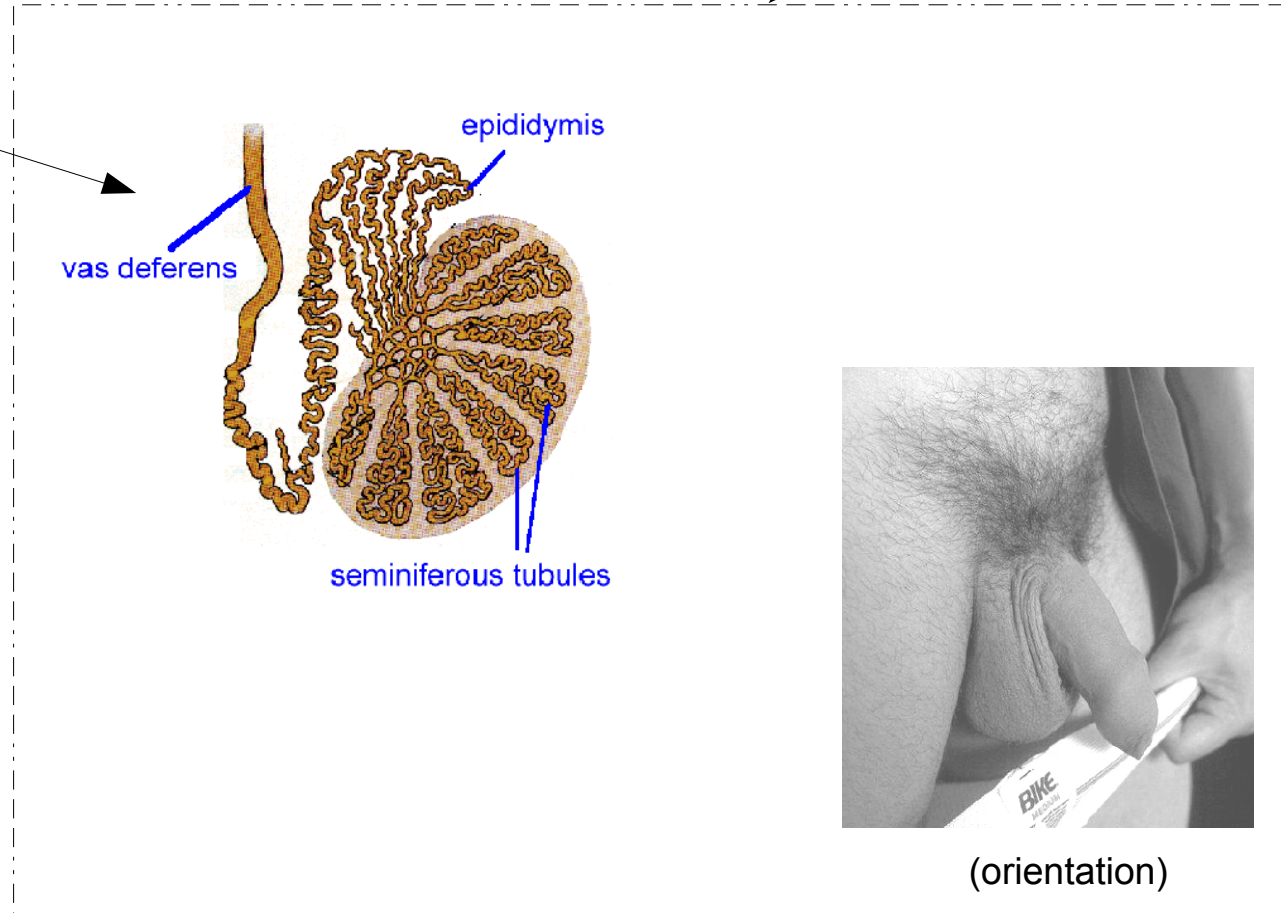

Vertebrate evolution

Flashback to year 1: Adult testicular anatomy:

(one of your 1st year slides)

(orientation)

Development of the human excretory system

25 days

26 days

28 days

mesonephros

Metanephrogenic
mesenchyme

Branching of the ureteric bud

0 days

1 day

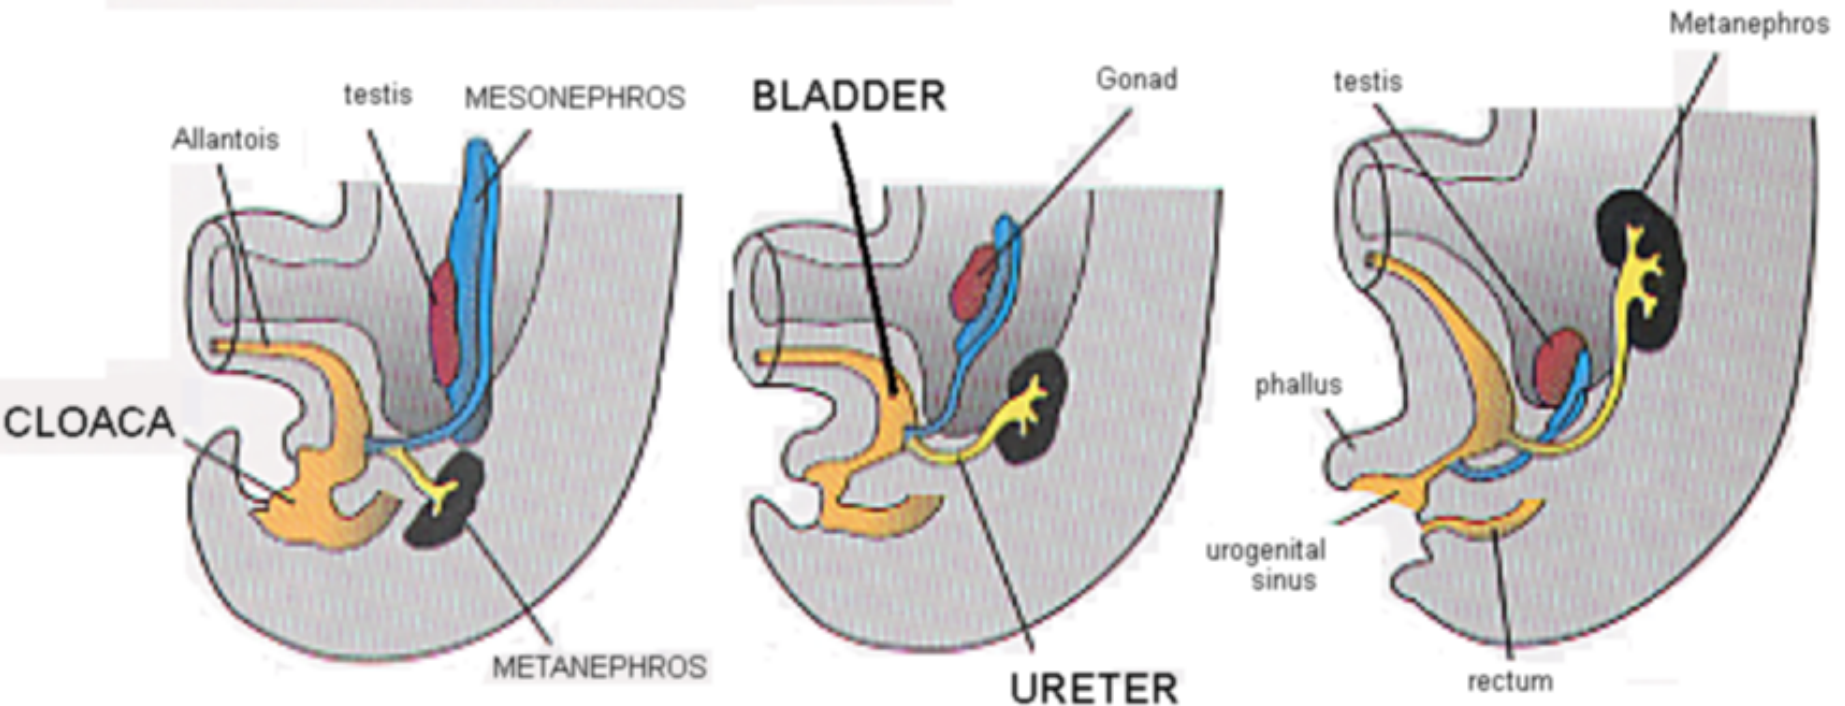

2 days

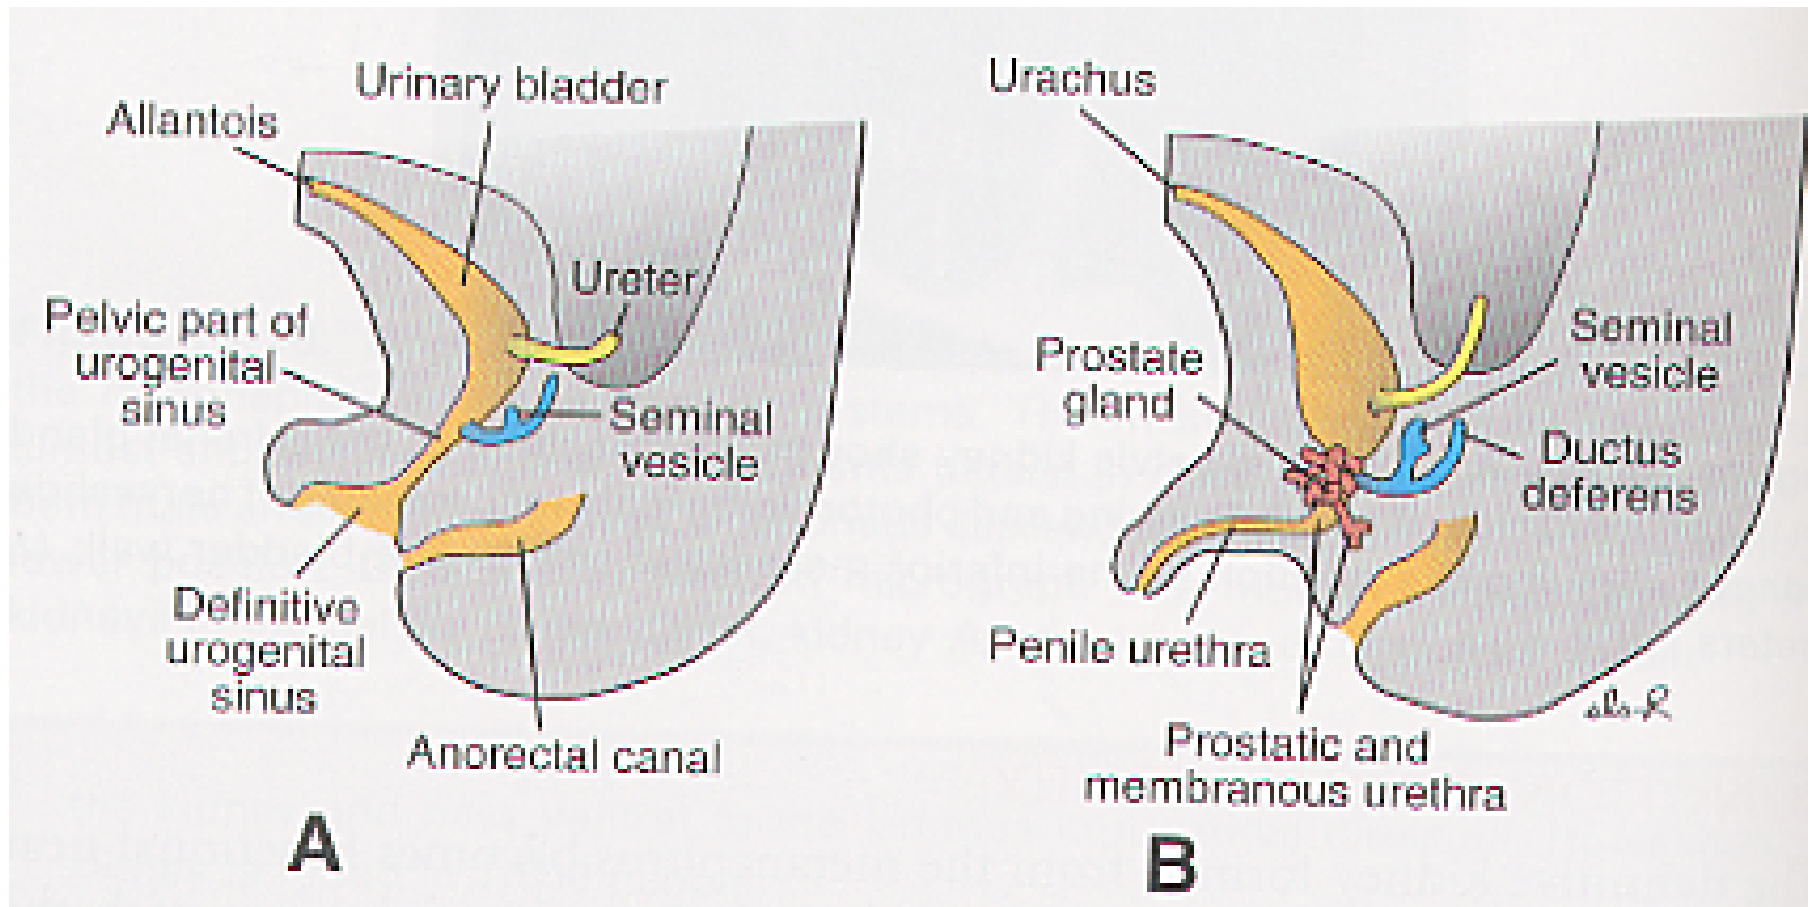

Nephrons form from stem cell populations that cap the branching bud tips

Development of the bladder

Development of the prostate

Components of semen

- Testis – sperm
- Prostate – citric acid, enzymes, acidic proteins
- Sem. Ves. – fructose, basic proteins

Timing of release

Prostate

Epididymis

Sem. Ves

Sex-specific development of nephric and Mullerian ducts.

MALE

- Indifferent gonad develops testis cords
- Testis cords connect to som mesonephric tubules (->epididymis)
- Mullerian duct regresses
- Distal nephric duct sprouts seminal vesicles – the part the nephric duct distal to this is the ejaculatory duct
- Urethra sprouts prostate and bulbourethral glands.

FEMALE

- Indifferent gonad develops into an ovary
- Upper Mullerian ducts become fallopian tubes
- Mullerian ducts converge & fuse to become the uterovaginal canal
- Nephric ducts and mesonephros degenerates
- Uterovaginal canal forms uterus and upper part of vagina. (Lower part from urogenital sinus)

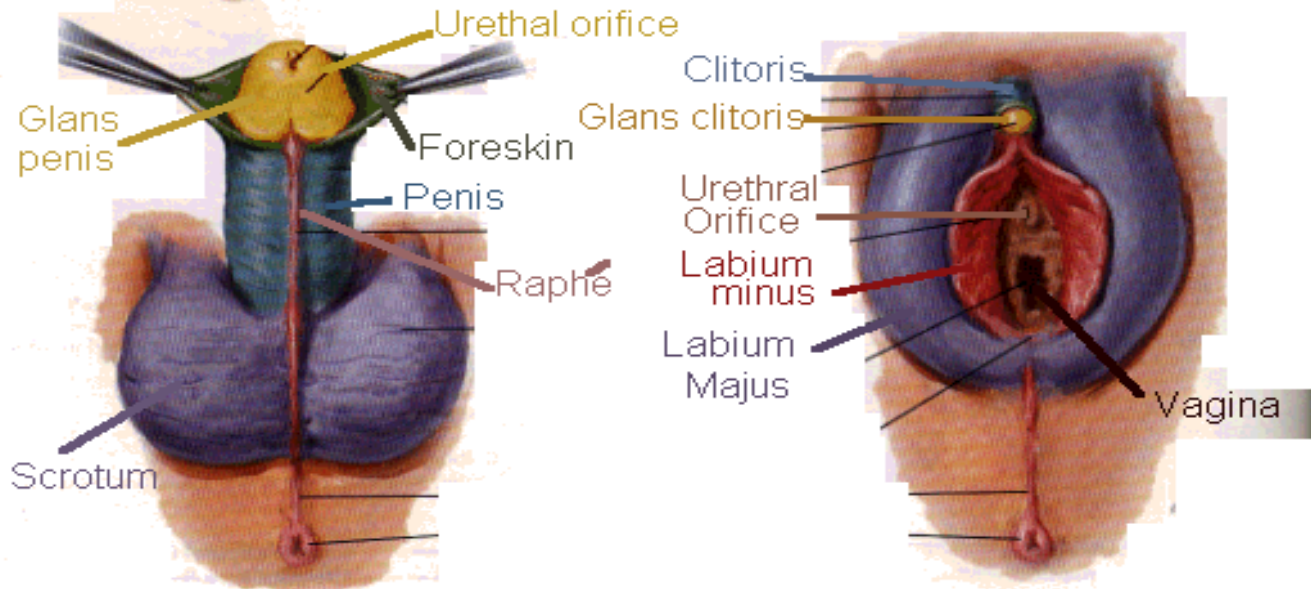

The opening to the world

His:

Urethra runs along
penis and opens at
its end

Hers:

Urethra ends within
vulva and does not
run to end of clitoris.

From
*Atlas of
Human
Anatomy*
(Netter)

Resultant anatomy is quite variable (in both sexes): this is not a problem.

(RESTART RECORDING)

But this is a problem:

Unscrupulous “doctors” (if they merit that word) are preying on body shame and body insecurity to persuade people to undergo surgical/ medical procedures to conform to some societal ideal.

IMPORTANT!
Special Instructions for Growth

ExtenZe™

The #1 Penis Growth Compound Worldwide

It Doesn't Matter If You're Small, Medium or Large . . . ExtenZe Can Make You Up To 25% Larger

ExtenZe takes between three and four months to reach its full potential. You must take one tablet a day (preferably with a meal) for three to four months. Therefore, don't stop after the first month. This product was designed to take a gradual three to four month period to work, so as not to overtax the male body. Most men notice only the slightest, if any, difference in size during their first 30 days of use. During the next 30 days, most men experience a small increase in length and that their erections are harder

Your generation of doctors may have to work harder than any other to protect patients from body-shame and its psychological consequences.

One specific variation, prepuce removal, may be surgically-imposed on some people in very early childhood (dependent on cultural identity and national cultural norms).

Uncircumcised

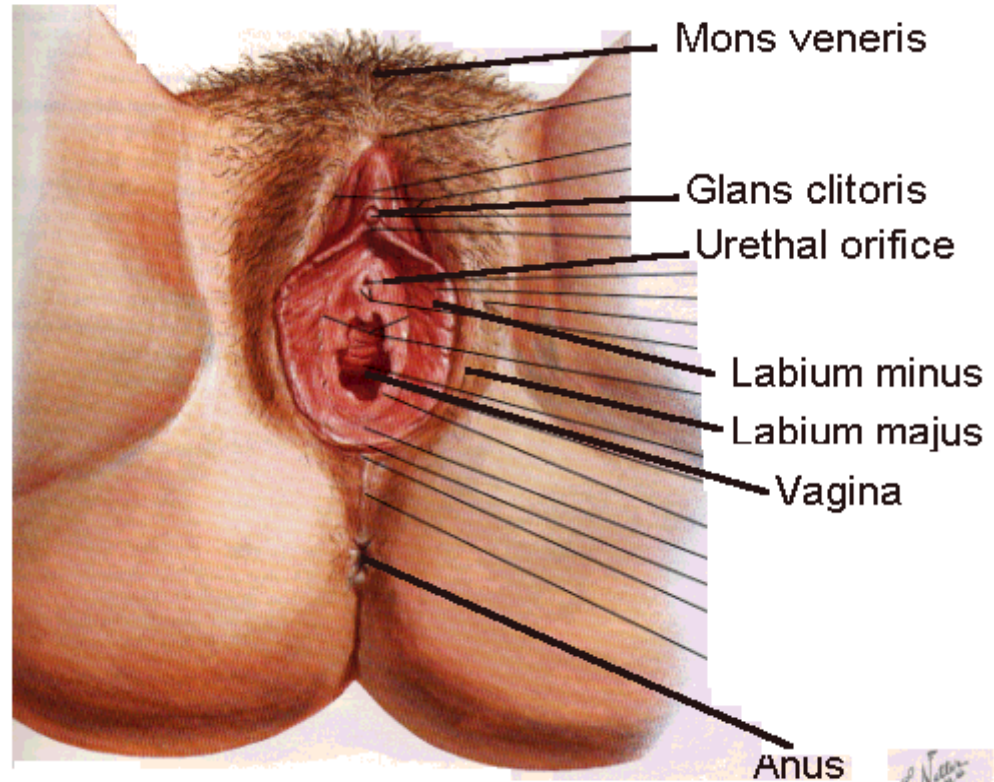

Circumcised

(there are variations in exact appearance here too, depending on precise procedure)

(Female childhood genital mutilation is strictly illegal in the UK and most other countries. The specific type of male childhood manipulation shown above is legal. Wearing your HES hats, you may want to think about how this fits with medical ethics).

Female anatomy (a typical 'medical drawing' made with labia parted):

More variation:

Anular hymen Septate hymen Cribriform hymen Parous introitus

← All are “normal” from a clinician's point of view but can be culturally significant.

Of course, 'resting' female anatomy tends to be more hidden – don't expect it to be like the textbook drawing I just showed:

L'Origine du monde, Gustav Courbet 1868.

Tangent (not on year 2 exam syllabus): psychosocial aspects of these organs

A scholarly study.

c. 100 people photographed (just that part) and interviewed anonymously about their feelings about it.

Not urogenital, but also relevant to psychosocial aspects of parts usually covered. Same author as above, and idea: 100 photos and interviews.

The interviews in the photo books are by no means restricted to sexual aspects; giving birth, feeding babies, surviving cancer, eating disorders, gender reassignment etc all feature a lot.

Congenital Abnormalities

We'll consider the kidney first,
then the bladder, then the external
genitalia

Renal Agenesis

- Bilateral – No kidneys form. Rare; fatal after birth. Lack of amniotic fluid causes Potter's Facies.
- Unilateral – One kidney missing. Common (1/500). Often no clinical implications unless some bright surgeon removes the working one.

Potter's Facies

- Flat nose
- Flat chin
- Ears against head

Congenital Cystic Disease

R₁₁

Congenital Abnormalities of Cloacal Development

Failure of correct positioning of Rathke and Tourneaux folds results in;

- Rectovaginal fistula
- Rectoprostatic fistula
- Rectocloacal canal (rectum, vagina and urethra unite inside body).

In males, incomplete migration of the urethral groove from the base of the penis to its tip results in hypospadias.
